features.py — Responsible for creating and transforming input features required by the ML model.

train.py — Responsible for training the ML model using the prepared features and saving the trained model.

predict.py — Responsible for loading the saved model and making predictions on new input data.

validate.py — Responsible for checking whether the input data is valid and follows the expected format/rules.

__init__.py — Responsible for making the directory a Python package and optionally exposing package-level components.
